# Table of Contents

1. How Standards are made
2. CoAP
3. CoAP DDOS

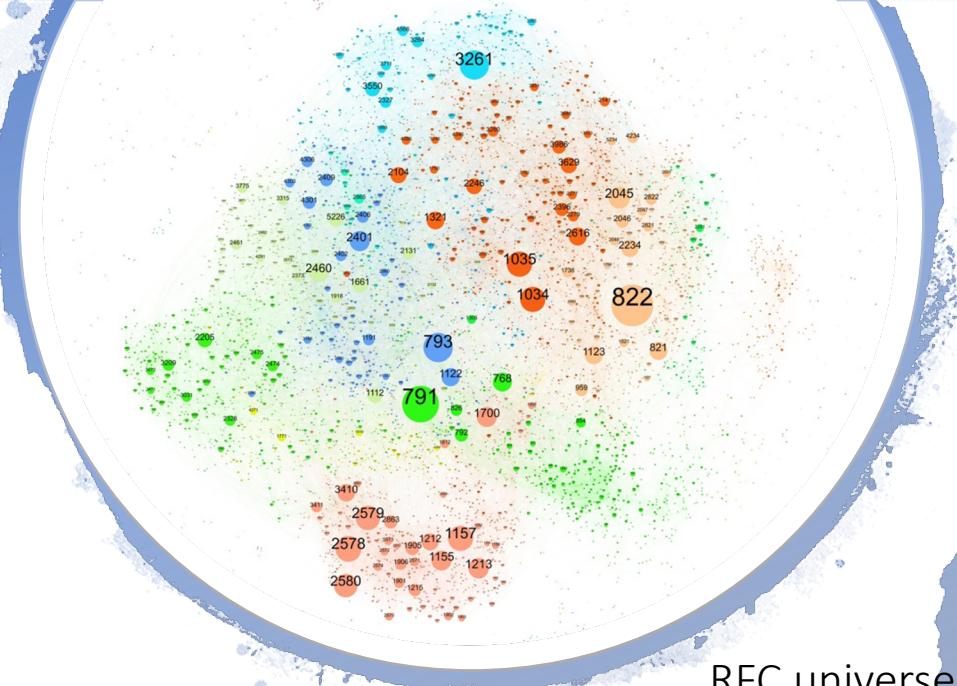

# Internet Engineering Task Force (IETF)

# The Internet

Evolved from US ARPANET back in 1986.

1998	50 million users	25 million servers
2018	3.4 billion users	20 billion devices

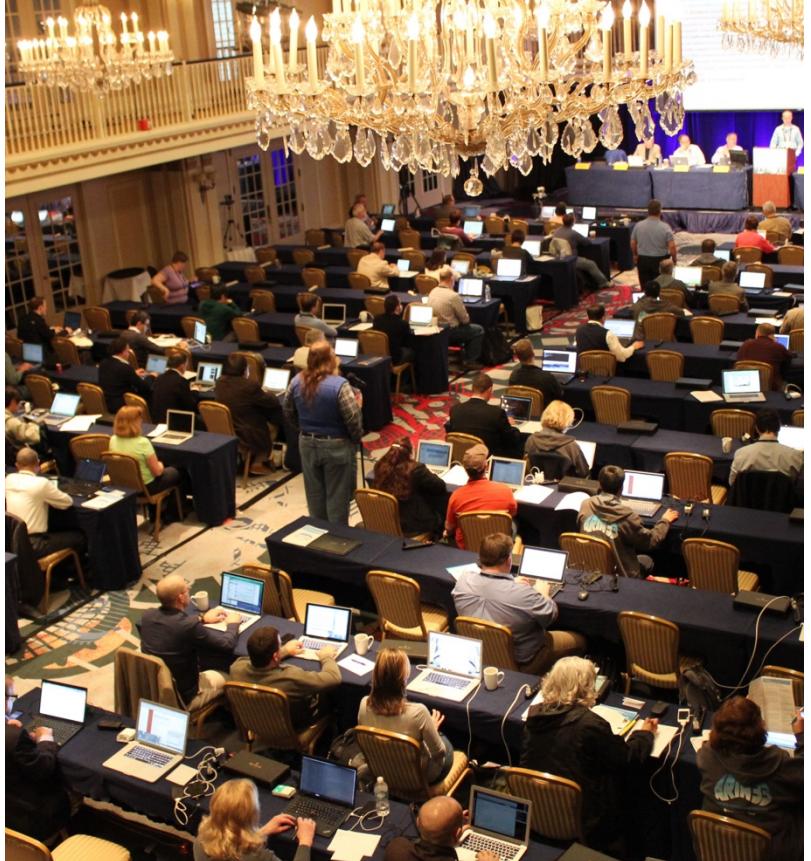

RFC universe  
courtesy of [Peter Krantz](#)

**3 billion** unique IPv4 addresses today.  
Billions of IPv6 devices tomorrow.

# The IETF mission

- IETF's role: Specify the underlying, fundamental Internet technologies
- “Permissionless innovation” - others can build on top - unlike “App Stores” or Telco services.
- RFC3935: “The goal of the IETF is to make the Internet work better.”
- Some well known achievements ...
  - [RFC791](#) The Internet Protocol.
  - [RFC792](#) The Internet Control Message Protocol.
  - [RFC821](#) The Simple Mail Transfer Protocol.
  - [RFC768](#) User Datagram Protocol.
  - [RFC959](#) The File Transfer Protocol.
  - [RFC793](#) The Transmission Control Protocol.
  - [RFC854](#) Telnet Specification.
  - [RFC1119](#) Network Time Protocol.
  - [RFC1157](#) A Simple Network Management Protocol.
  - [RFC1035](#) Domain names - implementation and specification.
  - [RFC1945](#) Hypertext Transfer Protocol.
  - [RFC2131](#) Dynamic Host Configuration Protocol.
  - [RFC3261](#) The Session Initiation Protocol.
  - [RFC6455](#) The WebSocket Protocol.
  - [RFC5321](#) Simple Mail Transfer Protocol.
  - [RFC7540](#) Hypertext Transfer Protocol Version 2.
  - [RFC6749](#) The OAuth 2.0 Authorization Framework.
  - [RFC4271](#) The Border Gateway Protocol.
  - [RFC4287](#) The Atom Syndication Format.
  - [RFC4251](#) The Secure Shell (SSH) Protocol Architecture.
  - [RFC8200](#) Internet Protocol, Version 6 (IPv6) Sepcification.

"Rough consensus and running code"

# The IETF Organization

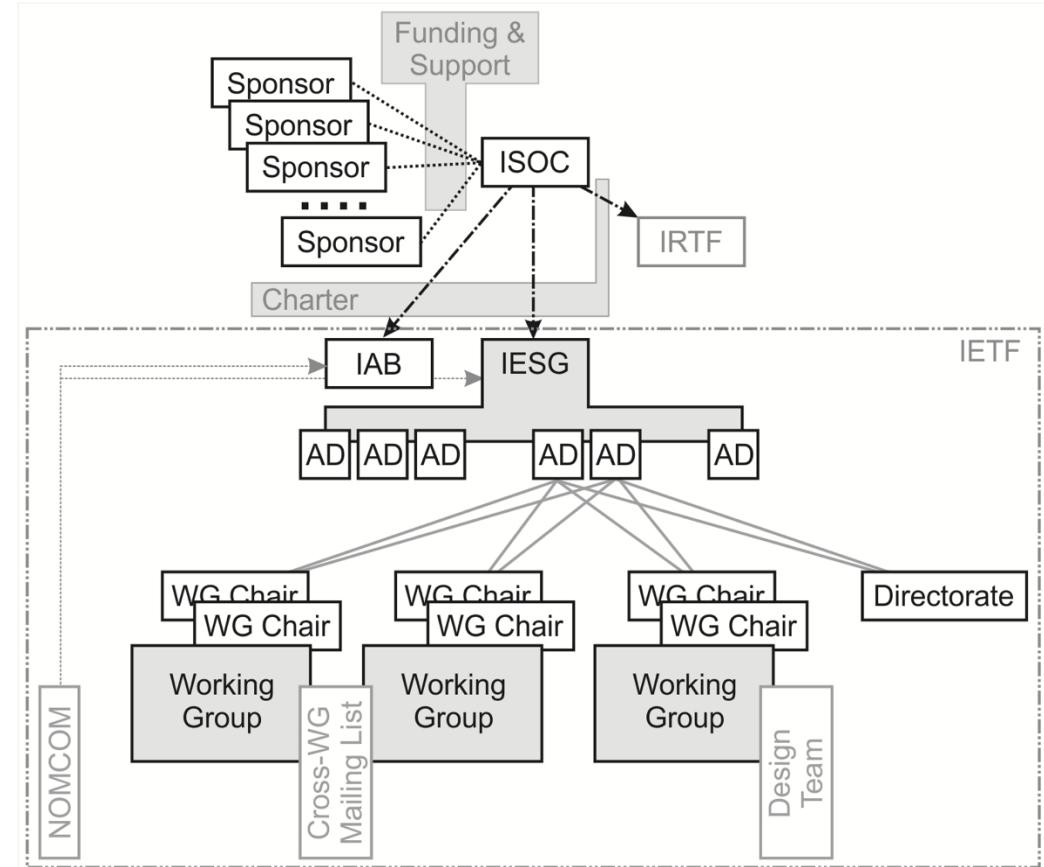

Technical work of the IETF is done in its [Working Groups](#), which are organized by topic into several areas (e.g., routing, transport, security, etc.).

IETF working groups are grouped into areas, and managed by Area Directors.

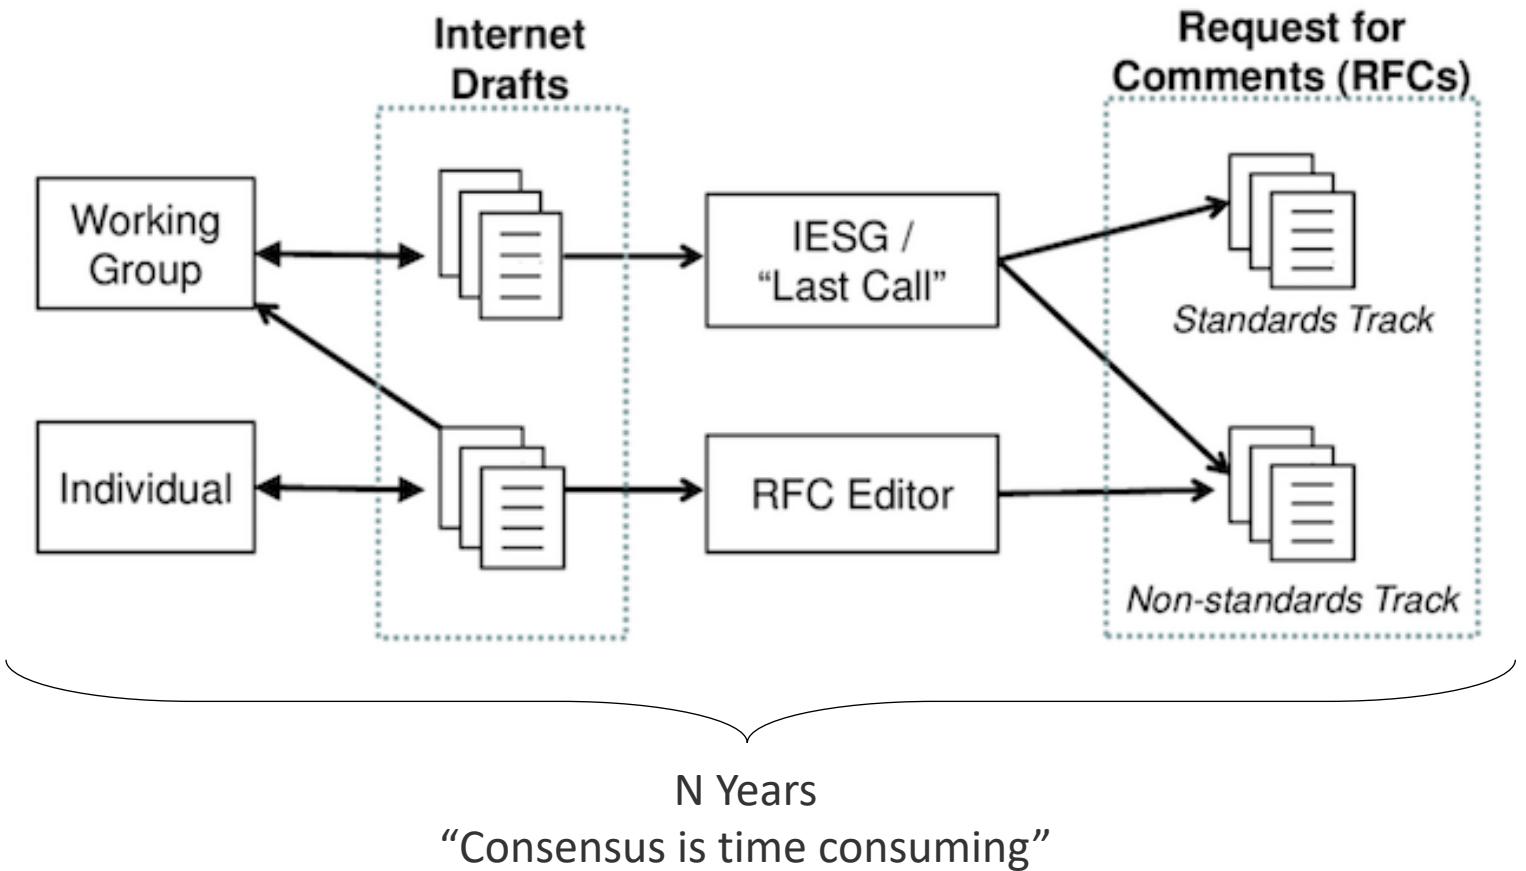

The ADs are members of the Internet Engineering Steering Group ([IESG](#))

The Internet Architecture Board, ([IAB](#)) is responsible for defining the overall architecture of the Internet, providing guidance and broad direction to the IETF.

The IAB also serves as the technology advisory group to the Internet Society ([ISOC](#)).

# A draft's lifetime

# Ways of working: RD Example

Working on the draft

<https://github.com/core-wg/resource-directory>

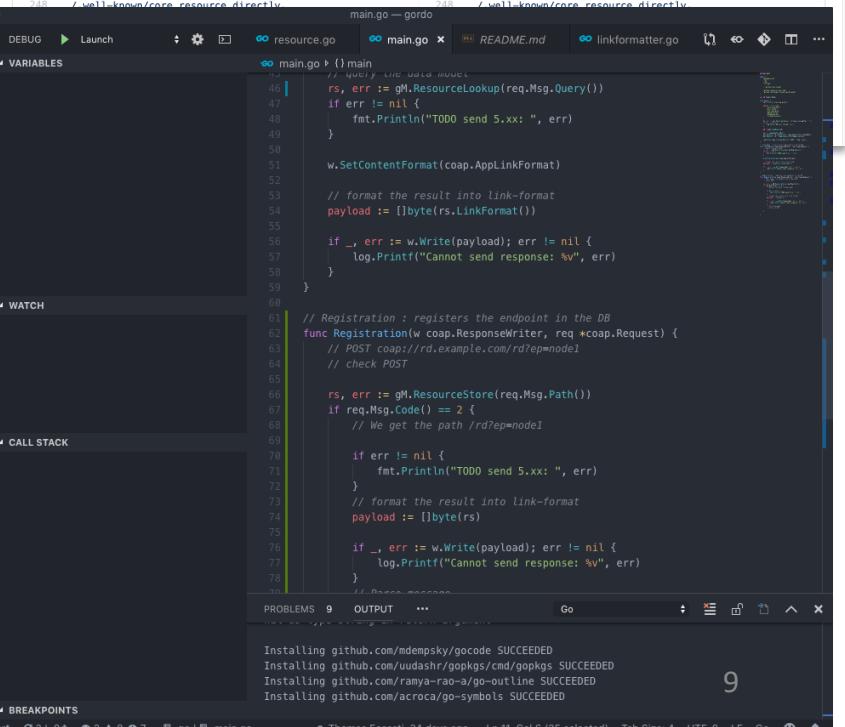

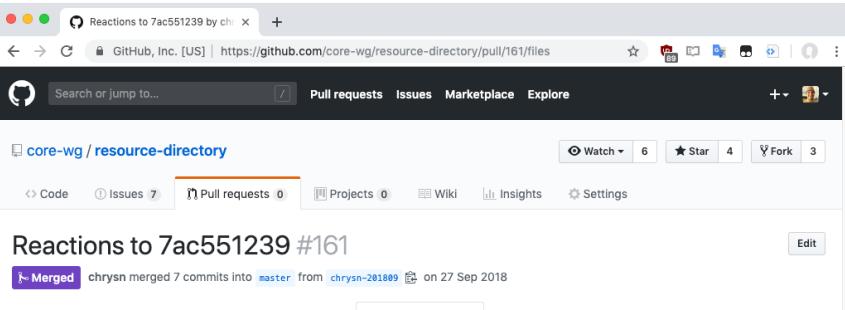

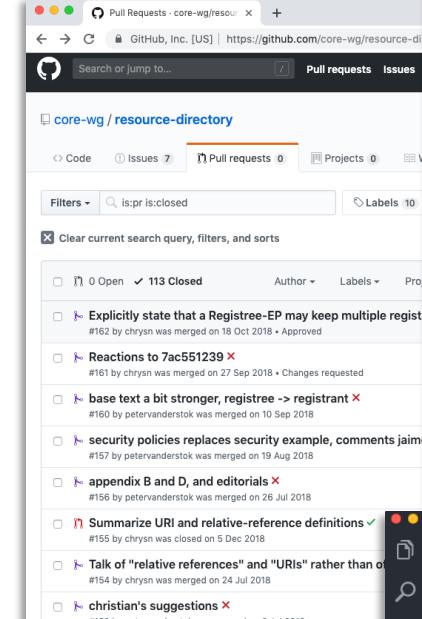

Working on the code

<https://github.com/thomas-fossati/gordo>

Other examples

<https://github.com/Ell-i/coap-rd>

<https://github.com/nning/core-rd>

The image shows three screenshots illustrating the Resource Definition (RD) process:

- Top Left:** A screenshot of the GitHub repository "core-wg/resource-directory". It shows the "Pull requests" tab with several open pull requests. One pull request, #161, is highlighted.
- Top Right:** A screenshot of the same GitHub repository showing the "Reactions" section for pull request #161. It lists various comments and suggestions from maintainers like chrysn and Jaime.
- Bottom:** A screenshot of an IDE (Visual Studio Code) showing the "main.go" file for the "gordo" project. The code implements the RD logic, including resource lookup and link format handling. The "WATCH" and "CALL STACK" panes are also visible.

# Constrained Application Protocol (CoAP)

# IETF: dozen+ years of IoT standards

Connectivity WGs

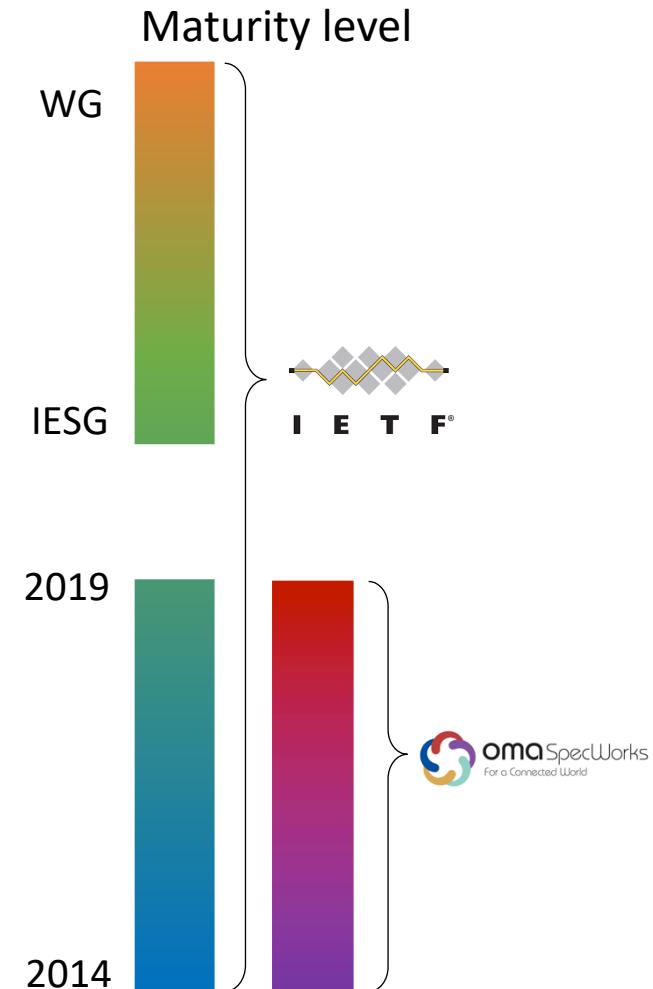

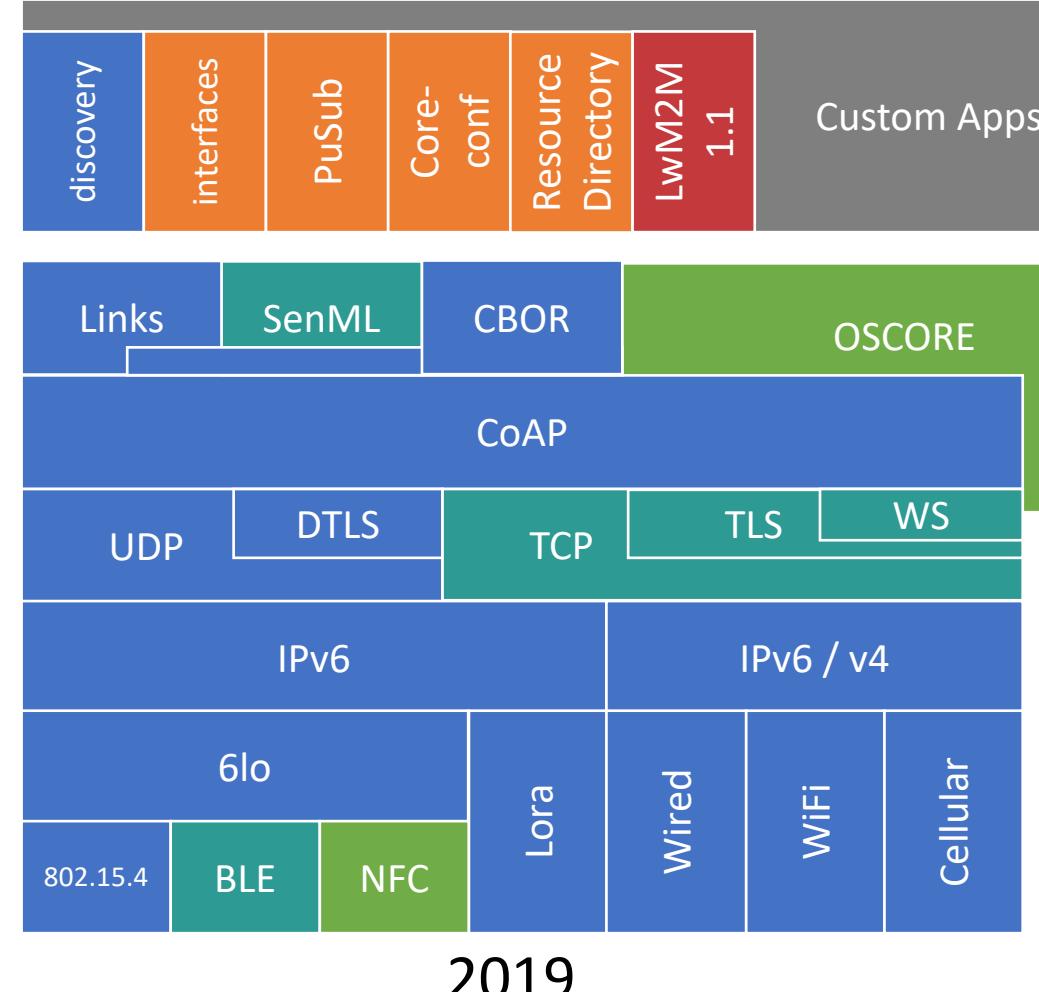

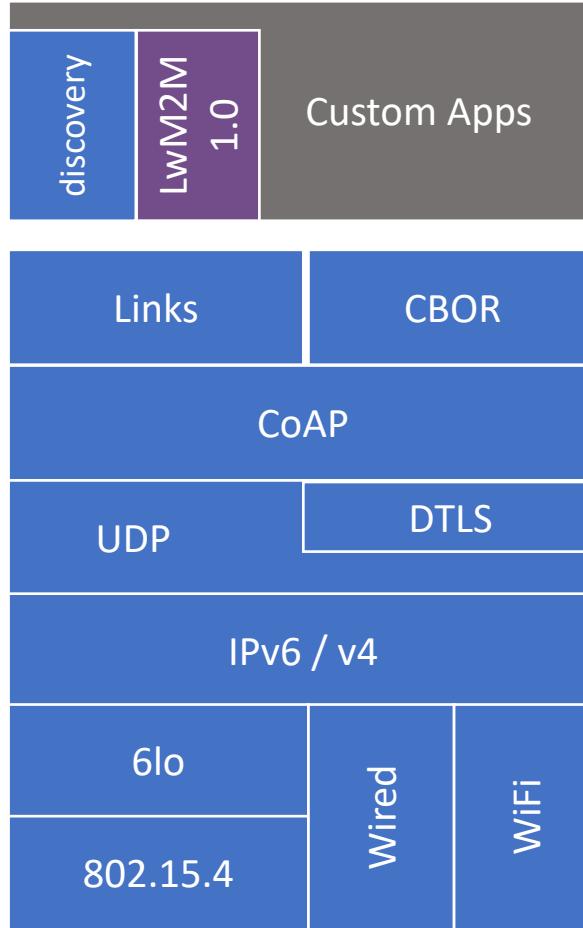

Application WGs

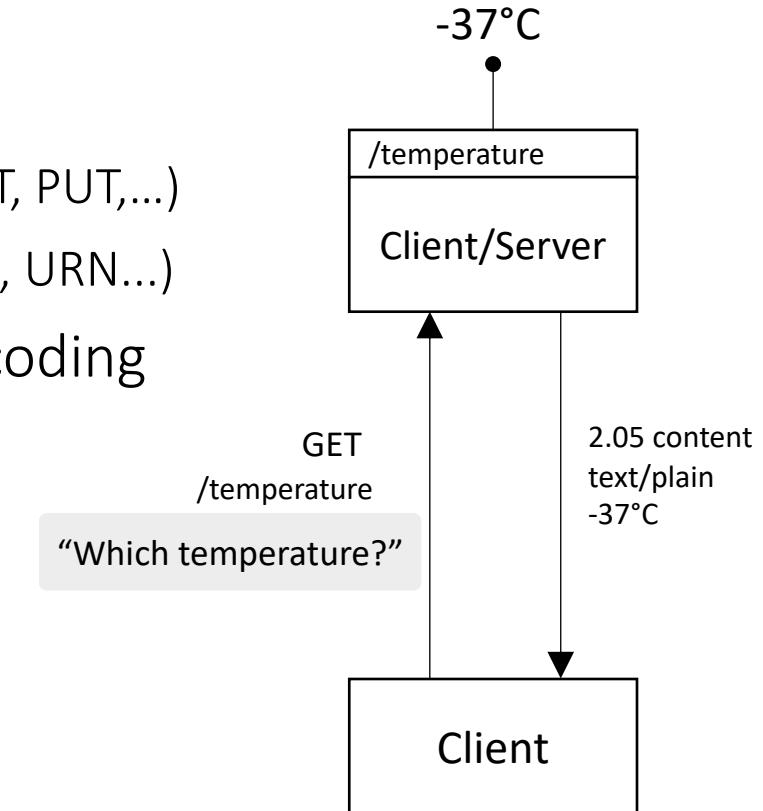

Security WGs

# Standards Device Stack

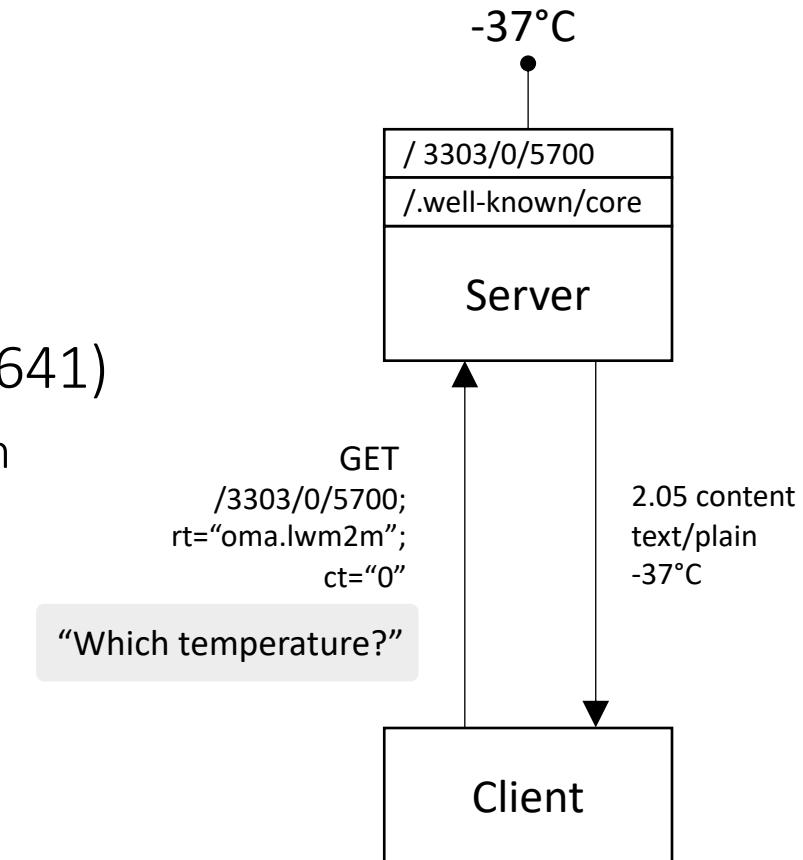

# The Constrained Application Protocol (CoAP)

- CoAP (RFC7252) implements HTTP's REST model
  - Simple devices: 100 to 250 KiB code and 10 to 50 KiB RAM
  - Each device can be client and server exposing resources
  - CoAP defines methods to access those resources (GET, POST, PUT,...)
  - Same key concepts borrowed from HTTP (Media types, URL, URN...)
- Has a compact 4-byte header, with simple options encoding
- Simple protocol, datagram (UDP, DTLS)
  - Reliability through header message type "CON/NON"
  - With TCP/TLS (RFC8323) support for NAT-ed environments
- The Resource Directory provides a directory service

# The Constrained Application Protocol (CoAP)

- CoRELink (RFC6690) provides a link format
  - Reuses Web Linking RFC5988 for IoT.
  - Enables query parameters for discovery (lt, gt...)
  - Enables attribute and relation types (rt, if, sz).  
`<3303/0/5700>;rt="oma:lwm2m:temp";ct="0"`
- Notifications available through *observe* option (RFC7641)
  - Can observe and add query parameters to the observation  
`<3303/0/5700?lt=0>`
- The “/.well-known/core” URI provides discovery
- Multiple serialization formats used with CoAP
  - SenML (RFC8428): Minimalistic JSON
  - CBOR (RFC7049): Binary serialization
- Multiple implementations available at [coap.technology](http://coap.technology)

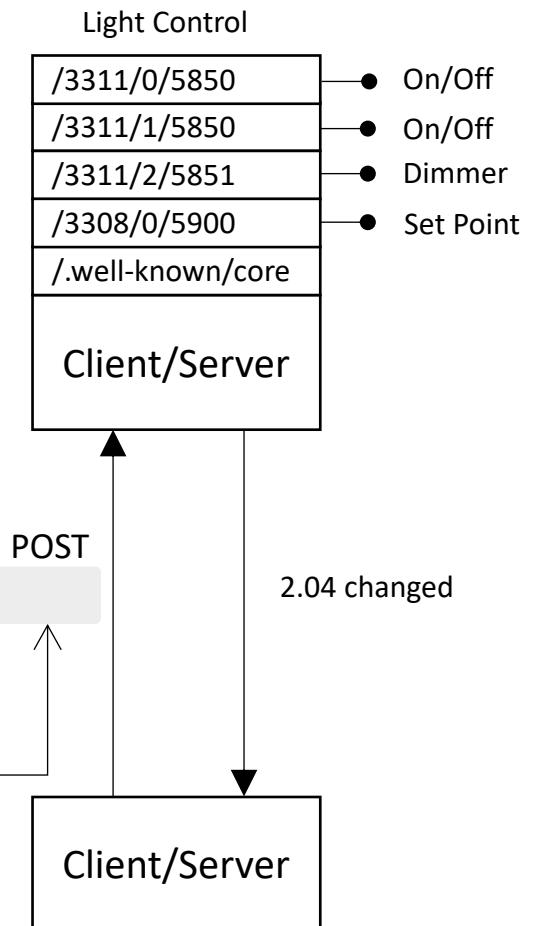

# Example Actuation

- When using IPSO actuation is handled with executable (E) resources as well as readable and writeable ones (RW).
  - Parameters needed for actuation are passed along on resources.
  - Type and range of values are known to client based on the schema.
  - Actuation can use executable and writeable (EW) resources.

A server Write-Composite to switch off 2 light sources, dim a 3rd to 20% and set the thermostat to 18 degrees will have a JSON payload as shown in table below. Lights are all controlled by instances of IPSO Light Control Object (Object ID 3311), while thermostat is controlled by an instance of IPSO object Set Point (Object ID 3308).

```
[ {"n": "/3311/0/5850", "vb": false},  
 { "n": "/3311/1/5850", "vb": false},  
 { "n": "/3311/2/5851", "v": 20},  
 { "n": "/3308/0/5900", "v": 18}]
```

# Distributed Denial of Service (DDOS) and CoAP

# Record-breaking attacks

- [1] Devices infected by Mirai continuously scan the internet for the IP address of Internet of things (IoT) devices. Mirai includes a table of IP Address ranges that it will not infect, including private networks and addresses allocated to the United States Postal Service and Department of Defense.<sup>[14]</sup> Mirai then identifies vulnerable IoT devices using a table of more than 60 common factory default usernames and passwords, and logs into them to infect them with the Mirai malware.<sup>[6][15][16]</sup> Infected devices will continue to function normally, except for occasional sluggishness,<sup>[15]</sup> and an increased use of bandwidth. A device remains

The screenshot shows a news article from Ars Technica. The header reads "BIZ & IT — Record-breaking DDoS reportedly delivered by >145k hacked cameras". Below the headline, a sub-headline says "Once unthinkable, 1 terabit attacks may soon be the new normal." The author is Dan Goodin, and the date is 9/29/2016, 3:50 AM. The ZDNet logo is visible at the bottom left.

The screenshot shows two side-by-side screenshots. On the left is a GitHub repository for "jgamblin / Mirai-Source-Code" showing the source code for the Mirai botnet. On the right is a Shodan search interface with a red dashed box highlighting the search bar where "default password" is typed. The search results show a total of 68,870 results across various countries, with a world map showing the distribution. Below the map is a table of top countries affected:

Country	Count
Taiwan	9,957
United States	8,743
China	5,139
Brazil	4,147
Thailand	3,383

Below the country table is a section titled "TOP SERVICES" with a list of services and their counts:

Service	Count
Telnet	19,791
HTTP (8080)	13,075
8081	6,294
Automated Tank Gauge	5,601
HTTPS	3,360

- [2] The CoAP protocol is the next big thing for DDoS attacks

CoAP DDoS attacks have already been detected in the wild, some clocking at 320Gbps.

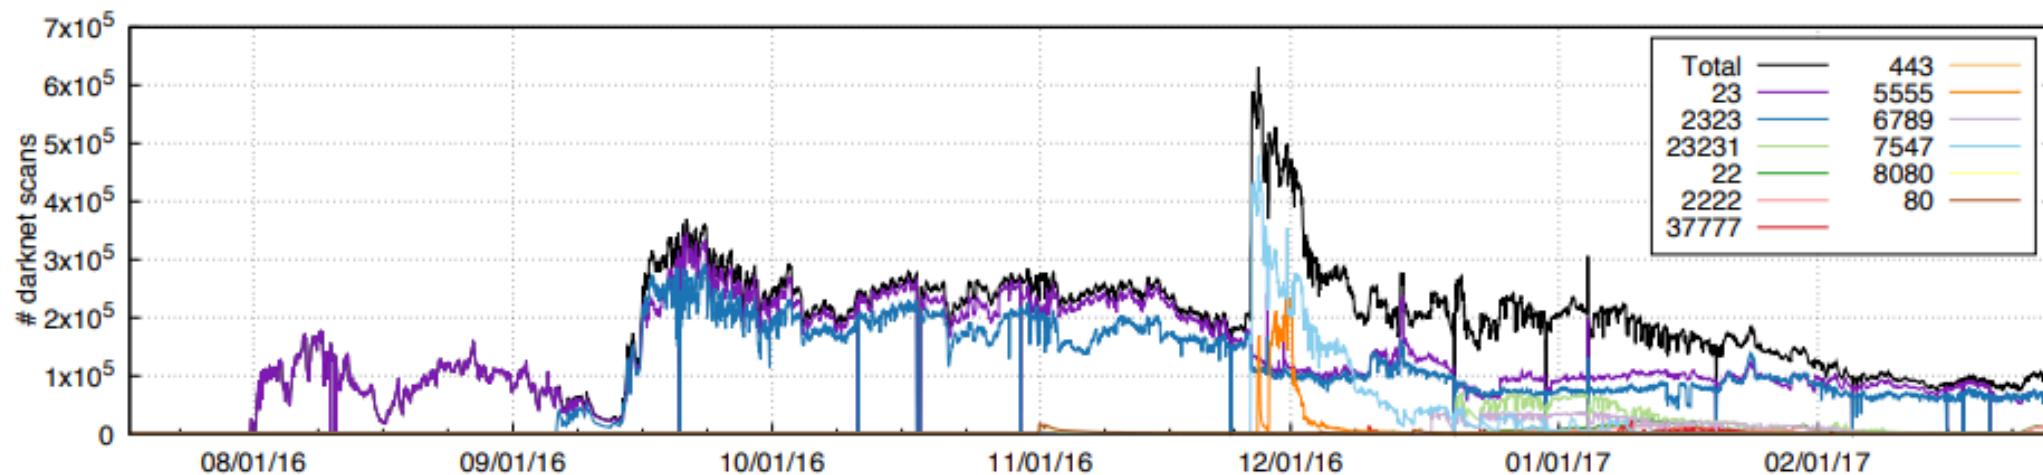

By Catalin Cimpanu for Zero Day | December 5, 2018 -- 04:13 GMT (04:13 GMT) | Topic: Security

[1] [https://en.wikipedia.org/wiki/Mirai\\_\(malware\)](https://en.wikipedia.org/wiki/Mirai_(malware))

[2] <https://www.zdnet.com/article/the-coap-protocol-is-the-next-big-thing-for-ddos-attacks/>

# DDOS

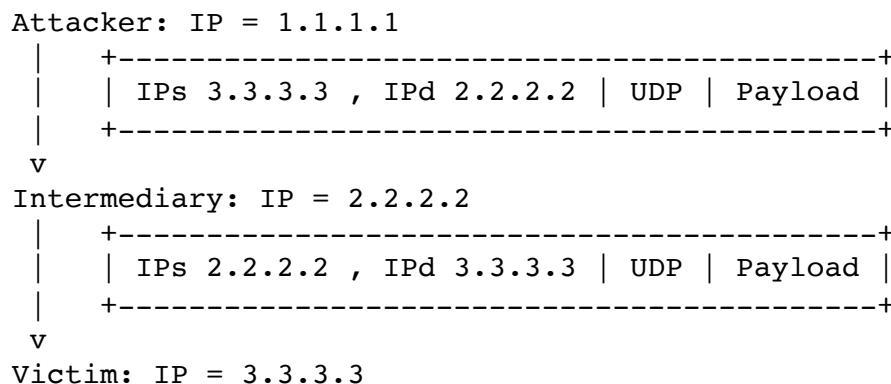

- The purpose of any denial-of-service attack is to limit the availability of a service.
- Distributed denial-of-service (DDoS) attacks came to public notice when they were used to bring down Panix, a New York ISP, for several days in 1996.
- Over time they improved:
  - 2007 hit 6 out of the 13 [ROOT DNS servers](#) back.
  - 2016 [Mirai's](#) botnet, used to perform very large (600Gps) DDoS attacks using an average of 300.000 infected devices (i.e., DVRs, IP cameras, routers, and printers) and as many as 600000.
- DDOS is used to blackmail, DDOS can be hired as cheap as [15€ a month](#).

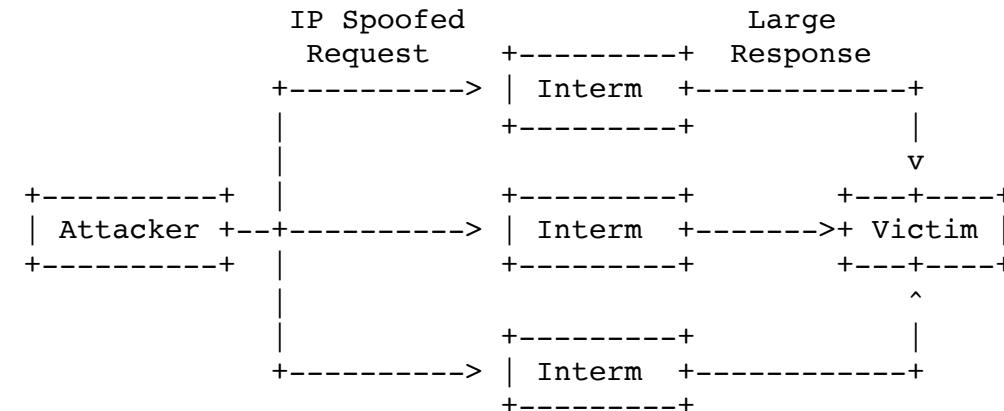

# UDP is part of the (hard to solve) problem

- UDP is a simple, connection-less transport protocol.
  - No handshaking
  - No dedicated end-to-end connection
  - Has multicast
- Useful in the IoT context *and* in DDOS
- Two types of attacks

## 1. IP Address Spoofing

## 2. Packet Amplification

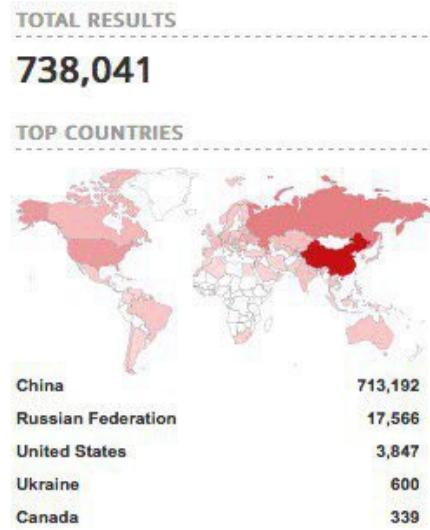

$$\text{Amplification} = \text{number-of-devices} * (1 \text{ MBps} * \text{Amplification Factor})$$

# Enter CoAP

- RFC7252 [Security Section](#) already warned about these attacks.
- As CoAP becomes more mainstream, there will be more attacks.
- CoAP has already been used already reaching [55Gbps on average.](#)
- Number of visible CoAP endpoints increased rapidly from 6500, to 220000, to 738041 and down to 436854 after patching.
- CoAP has a substantial Amplification Factor, and a huge number of potential endpoints.

# Some solutions

- Avoid NoSec mode, using instead any of the other [secure modes](#).
- Avoid exposing CoAP endpoints to the wider Internet if they don't need to.
- Using a randomized token value.
- When using CON messages we can detect unexpected ACK and RST from the deceived endpoint.
- Verify every now and then that observations are still valid by sending a CON from the observed CoAP resource.
- Limiting the response rate can also palliate the problem.
- Routers and middleboxes have high bandwidth, which is a scarce resource in the case of constrained networks. That will be a mitigating factor, making CoAP nodes less attractive for this attack.
- Large amplification factors should not be provided if the request is not authenticated.
- CoAP servers should not accept multicast requests that can not be authenticated in some way
- Ensure all default passwords are changed to strong passwords.
- Update IoT devices with security patches as soon as patches become available.
- Network operators could prevent the leakage of packets with forged source addresses by following the guidelines of [RFC2827](#).
